

● System: means an organized relationship among functioning units or components.

● By research

verbally — 7%

Tone of voice — 38%

Facial & Body Ex — 55%

● Aspects of Body language

1. Facial disclosure
2. Eye contact
3. Posture

● Proxemics: relationship between people & space around them.

● Spatial Zones

- Intimate zone : closer than 1.5 feet
- Personal zone : from 1.5 feet to 4 feet
- Social " : " 4 " to 12 "
- Public " : beyond 12 feet

————— • —————

1. System requirement? - is a description

2. Requirement describe? - functions, features & constraints

3. Types of requirements (2) — [functional (function or feature)
Non-functional (description)

4. " " non-functional req, (Performance, information, Economy, Control)
Efficiency, Service)

5. Criteria to Define System Requirement? VCC FART

6. Process of Requirements Discovery?

- Problem discovery & analysis
- Requirement discovery
- Documenting & analyzing requirements
- Requirements management

7. Requirements Discovery

8. Fact-finding Methods -

9. Advantages & Disadvantages of Questionnaires

10. Types of Questionnaires (2) - Latitude in ans)
→ Free Format (offer the respondent greater)
→ Fixed " (selection of predefined responses)

11. Types of fixed format (3) - Latitude in ans)
→ MCQ
→ Rating questions
→ Ranking questions

12. Questionnaire Procedure

*** (5) - What facts
- Based - Test
- Write the ques. - Duplicate

13. Interviews - are a fact finding technique

14. Types of Interview (2) - Latitude in ans)
→ Unstructured
→ Structured (has a specific set of ques)

15. Advantages & Disadvantages

16. Procedure to conduct an Interview (4) +

17. Interview Questions

18. " DoB and Don'ts

19. Communicating with the user

20. Brainstorming.

21. Interview question

↓ ↓
Open-ended Closed-ended

(restrict answers to either choices or
short, direct responses)

CHAPTER - 8

1. **Model** - is a representation of reality

- ↳ Logical model : show what a system ^{is or} does
- ↳ Physical " : " not only " " " but also how system is physically and technically implemented.

2. **Process modeling** : is a technique for organizing and documenting the structure and flow of data through a system processes,

3. **DFD** : is a tool that depicts the flow of data through a system and the work on processing performed by that system.

4. **External Agent** : defines a person, organization unit, or other organization that lies outside of the scope of.

5. **Data stores** : A data store is an inventory of data.

e.g : File / database.

3 Symbols

- Round rectangle (processes)
- Square (external agents interface color)
- Open ended boxes (data store)

DFD vs Flowchart

	DFD	Flowchart
processes	can operate in parallel	on flowcharts execute one at a time
show	flow of data through a system	flow of control
processes	on one DFD can have dramatically different timing	are part of single program with consistent

8. **System Thinking** - application of formal systems theory and concepts to systems problem solving.

9. **Process** : A process is work performed on, or in response to, incoming data flows or conditions.

10. **Decomposition** : is the act of breaking system into its component subsystems, processes and sub-processes

11. **Decomposition Diagram** : shows the top down, functional decomposition of a system.

12. Types of Logical processes

13. **Common process Errors on DFDS** ***

i. Black hole (3.1.2)

ii. has outputs but no inputs .

iii. Gray hole (most common errors) (3.1.1)

14. Data Flow

represents an input of data to a process, or output of data from process.

A control flow

represents a condition or nondata event that triggers a process

15. Data Flows to and from Data Stores

16. Illegal data Flow

ZolivoxTM
Lineolid USP

17. Data types : defines what class of data can be stored in an attribute.

18. Domain : defines what values or range of values an attribute can legitimately take on.

19. Diverging and Converging Data Flows:

20. Data Flow for and from Data Stores

21. Illegal Data Flow

Chapter-9

1. Feasibility : is the measure of how beneficial or practical the development of an information system.
2. Feasibility analysis : is the process by which feasibility is measured.
3. Creeping commitment
4. System development life cycle Plan-analysis-design-Implement.- Maintenance
5. Feasibility checkpoints (3)
6. Four's test for feasibility O T S E
 - How well the solution will work
 - How reasonable the project timetable is
 - measure of practicality of a technical soln.
 - a measure of the cost-effectiveness
7. Cost-Benefit analysis
8. 3 popular techniques to assess ECONOMIC Feasibility {
 - Payback
 - Return on Investment
 - Net present value
9. Time value of Money - concept
10. Payback analysis : simple & popular method for determining if and when an investigation will pay for itself.

11. Present value Formula : $PV_n = 1 / (1+i)^n$

n = number of years
 i = discount rate.

12. Return-on-Investment ÷ compares the lifetime profitability

13
$$\text{Lifetime ROI} = \frac{(\text{estimated lifetime benefits} - \text{E. I. costs})}{\text{estimate lifetime costs}}$$

14.
$$\text{Annual ROI} = \frac{\text{Lifetime ROI}}{\text{lifetime of the system}}$$

15. Factual Format vs Administrative Format
